

Navigate to `/student` to verify that the controller can fetch all students from the database and render them in the list view. If the setup is correct, you should immediately see any existing student records.

Click “Add New Student” to open the form, fill it with sample data, and submit. This checks that the controller can handle the insert action, persist the new student, then redirect back to the list page with a success message.

Student Management System

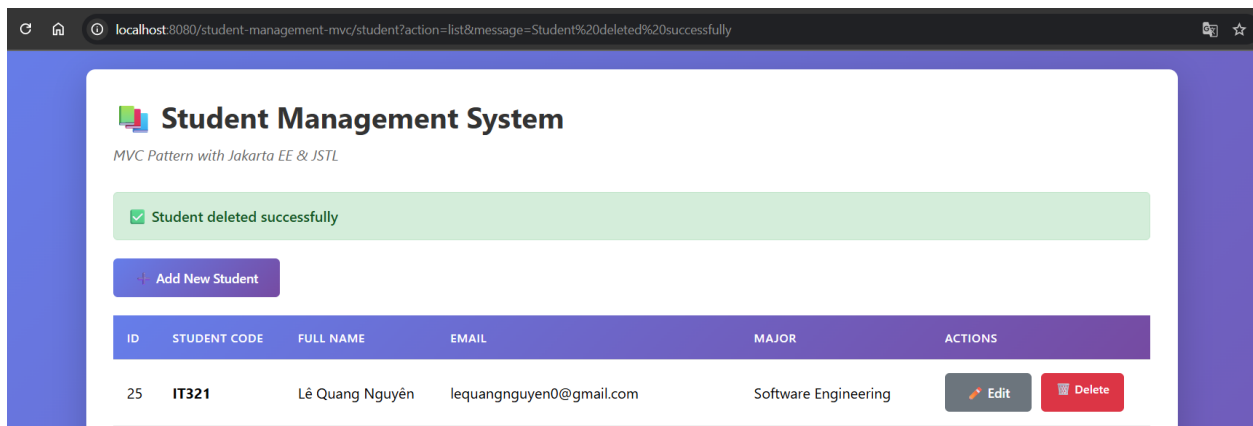

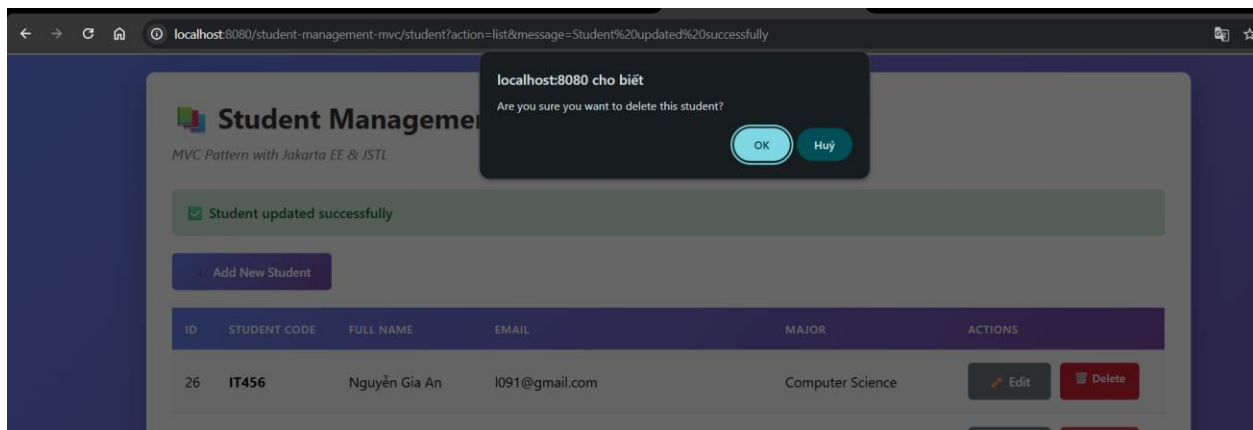

MVC Pattern with Jakarta EE & JSTL

✓ Student updated successfully

 Add New Student

ID	STUDENT CODE	FULL NAME	EMAIL	MAJOR	ACTIONS
26	IT456	Nguyễn Gia An	l091@gmail.com	Computer Science	 Edit  Delete

Click **“Edit”** on an existing student to open the same form in edit mode, with all fields pre-filled. After modifying the data and submitting, the test confirms that the update action works and that you are redirected with an update success message.

Click **“Delete”** on a student to ensure the browser shows a confirmation dialog before removing the record. After confirming, the app should delete the student in the database and redirect to the list page with a delete success message.

After deleting all students, reload the list page to verify that the UI handles an empty result set. Instead of showing a blank table, it should display a clear message such as **“No students found”**.
